### **Testimony for House Bill 2641 Reduce Waste Water Injection**

This is a picture of a crack that appeared late last summer, 2017. I have other pictures around the exterior and interior of never-before cracks in my house's structure. Cabinet doors at the opposite end of this small house, no longer close.

Yes, my house is its 100<sup>th</sup> anniversary this year. When I chose this house three 3 years ago, I was charmed that the house was outstandingly solid. I did some "improvements" but only to update the interior.

This house has endured 100 years of stability despite weather, aging, presumably settling—but NOW it's cracking, cracking after 100 years of solidity.

I believe this is due to recent earthquakes, little-known in Kansas until the recent past. My very cute house, which has soldiered through so many harsh Kansas summers and winters, appears to be succumbing to seismic results of fracking or of its deep water injections.

Thank you for accepting my sorrowful testimony.
