

Re: HB 2601

February 7, 2020

As a combat medic, I was vaccinating my fellow soldiers. In boot camp, we were all lined up and shot up with multiple toxins all at once. I'm well versed in the "safe and effective" religion. I believed it. I breathed it. Oddly enough, my daughter (who was almost 2 at the time and full vaccinated) became ill with rubella (german measles). Her immune system was not strong enough to fight it. She wasn't even able to cry. It was the scariest month of my life. I wasn't sure if she was going to make it. Everything I believed to be true about vaccination was shaken.

I was never taught about vitamin A in my few pages of vaccine propaganda in AIT. I was completely unaware that vitamin A could help her. The doctor said he could do nothing since it was a virus. What I didn't know at the time was that the reason her immune system couldn't fight as well as it should have was because it was paralyzed and suppressed with all of the toxins that were injected to her. This was 10 years ago and caused me to question everything and research for myself.

My little sister got a brain tumor from the HPV vaccine and is now paralyzed on her left side. She will never have a normal life. She is in her 20s.

My ex-husband and fellow soldiers are shreds of the people they used to be. All of these injections add up. They are on several medications just to function enough to get out of bed in the morning. Why are soldiers so mentally ill? Heavy metals in the brain from the adjuvants in vaccines. I have seen the progression. It is so sad and heart breaking.

I have two daughters that are vaccine free. They have really enlightened me with what a healthy child looks like. I had no idea. I have only been around vaccinated children. It is amazing how much of an impact vaccinations have on children's health.

My niece suddenly contracted scoliosis after her booster shots and I had no idea that those two things were even relatable. After reading similar stories, I began to connect dots in her health problems. She was actually on a delayed vaccination schedule with MTHFR.
