Re: HB 2601

Dear Education Committee Members,

When my daughter turned 6 months I took her in for her regular check up and got her immunizations. It was soon that i realized the mistake that i had made. That night she cried for hours. It seemed to be never ending. Everyone i reached out to told me it was normal and she would be fine. I began looking into it further. I downloaded inserts and began reading. I then discovered that my daughter must have been suffering from encephalitis. She was in pain. The next day my daughter would not sit up, she was no longer babbling, she wouldn't laugh, she did nothing that she was once doing. She was like a newborn baby. She screamed a cry i had never heard before and ate. I felt hopeless. I then dove into what i could do to fix this. I began detoxing her. She is now a 3 year old who is very smart however, it was a long road to rebuild what we had lost. She gets sick easily and stays sick for awhile. Sickneses really take over her body. She also has eczema and an allergy to milk.
