

Dear Education Committee Members,

Please support Representative Huebert's bill, HB 2601.

I have many questions and red flags when it comes to vaccines. For example, why is a medical product with no liability being mandated across the country? Why when vaccines are in the testing phase are they not tested against an inert saline placebo? (They are in fact tested against a different vaccine, which can be found on the vaccine package inserts.) What is the cumulative effect of all the aluminum that is injected--how does it affect the developing brain of an infant? Why isn't the entire vaccine schedule tested as a whole, rather than each vaccine individually? Why are vaccines one size fits all when we are not a one size fits all society? (We have different genetic make-up, different weight, different food needs, etc.) Why, if vaccines are so safe and effective, is America one of the sickest countries with a high infant mortality rate compared with the developed nations? I could go on asking these questions, I have many more, as do others. I know you would walk away with plenty too if you did your own unbiased research.

After witnessing the way two of my children reacted to their vaccinations, I began to look more into the topic. When we had our third child, my husband and I were much more informed on the subject and chose to forego any vaccinations. He is the healthiest 14 month old boy I have ever met. So far, he has had two low grade fevers and a couple of days of a runny nose and that is it! No ear infections, no eczema, no stomach bugs, no asthma, no allergies, and no sick visits to the doctor.

Please vote on behalf of medical freedom, allowing parents the choice to do what they feel is best for their children, especially when it comes to injecting vaccines.

Thank you,

Anndrea Tholen
